DEPARTMENT OF ELECTRONICS AND COMMUNICATION ENGINEERING

Syllabus for M.Tech (ECE) Programme (2019)

Choice Based Credit System

`

RAJIV GANDHI UNIVERSITY,
RONO HILLS, DOIMUKH

Course Structure for Master of Technology
in Electronics and Communication Engineering w.e.f. July 2019

M. Tech Sem-I

Paper Code	Paper Title	Scheme of Studies Per Week			Credits
		L	T	P	
ECEC 411	Advanced Digital Signal Processing	3	1	0	4
ECEC 412	Wireless and Mobile Communications	3	1	0	4
ECEE 413X	Elective – I	3	1	0	4
ECEE 414X	Elective – II	3	1	0	4
*ECEA 415	Research Methodology and IPR	2	0	0	0
ECEL 416	Laboratory 1 (Advanced Digital Signal Processing)	0	0	2	2
ECEL 417	Laboratory 2 (Based on Elective)	0	0	2	2

Total Credits: 20

M. Tech Sem-II

Paper Code	Paper Title	Scheme of Studies Per Week			Credits
		L	T	P	
ECEC 421	Information Theory and Coding	3	1	0	4
ECEC 422	MEMS and Microsystems	3	1	0	4
ECEE 423X	Elective – III	3	1	0	4
ECEE 424X	Elective – IV	3	1	0	4
XXX-NNN	SWAYAM Course (Audit)	-	-	-	-
ECEL 426	Laboratory 1 (MEMS and Microsystems)	0	0	2	2
ECEL 427	Laboratory 2 (Based on Elective)	0	0	2	2

Total Credits: 20

M. Tech Sem-III

Paper Code	Paper Title	Scheme of Studies Per Week			Credits
		L	T	P	
ECEE 511X	Elective – V	3	0	0	3
ECE0 512X	Open Elective	3	0	0	3
ECEL 513	Laboratory 3 (Based on Elective)	0	0	2	2
ECEP 514	Dissertation-I	0	0	12	12

Total Credits: 20

M. Tech Sem-IV

Paper Code	Paper Title	Scheme of Studies Per Week			Credits
		L	T	P	
ECEP 521	Dissertation-I I	0	0	20	20

Total Credits: 20

*ECEA 415 and **XXX-NNN** are mandatory audit courses.

M.Tech (Electronics & Communications) Course Structure

M. Tech Sem-I

Paper Code	Paper Title	Marks Distribution			Total
		End Semester	Sessional/ Internal	Practical/ External	
ECEC 411	Advanced Digital Signal Processing	80	20		100
ECEC 412	Wireless and Mobile Communications	80	20		100
ECEE 413X	Elective – I	80	20		100
ECEE 414X	Elective – II	80	20		100
*ECEA 415	Research Methodology and IPR	80	20		100
ECEL 416	Laboratory 1 (Advanced Digital Signal Processing)		50	50	100
ECEL 417	Laboratory 2 (Based on Elective)		50	50	100

M. Tech Sem-II

Paper Code	Paper Title	Marks Distribution			Total
		End Semester	Sessional/ Internal	Practical/ External	
ECEC 421	Information Theory and Coding	80	20		100
ECEC 422	MEMS and Microsystems	80	20		100
ECEE 423X	Elective – III	80	20		100
ECEE 424X	Elective – IV	80	20		100
XXX-NNN	SWAYAM Course (Audit)	---	---		---
ECEL 426	Laboratory 1 (MEMS and Microsystems)		50	50	100
ECEL 427	Laboratory 2 (Based on Elective)		50	50	100

M. Tech Sem-III

Paper Code	Paper Title	Marks Distribution			Total
		End Semester	Sessional/ Internal	Practical/ External	
ECEE 511X	Elective – V	80	20		100
ECE0 512X	Open Elective	80	20		100
ECEL 513	Laboratory 3 (Based on Elective V)		50	50	100
ECEP 514	Dissertation-I		120	80	200

M. Tech Sem-IV

Paper Code	Paper Title	Marks Distribution			Total
		End Semester	Sessional/ Internal	Practical/ External	
ECEP 521	Dissertation-II		240	160	400

Program Outcomes of ECE (M. Tech.) program:

The main outcomes of the ECE (M. Tech.) program are given here. At the end of the program a student is expected to have:

1. An understanding of the theoretical foundations and the limits of Electronics and Communications Engineering.
2. An ability to adapt existing models, techniques, algorithms, devices, etc. for efficiently solving problems.
3. An ability to design, develop and evaluate new electronics based systems for novel applications which meet the desired needs of industry and society.
4. Understanding and ability to use advanced signal processing techniques and tools.
5. An ability to undertake original research at the cutting edge of Electronics and Communications & its related areas.
6. An ability to function effectively individually or as a part of a team to accomplish a stated goal.
7. An understanding of professional and ethical responsibility.
8. An ability to communicate effectively with a wide range of audience.
9. An ability to learn independently and engage in life-long learning.
10. An understanding of the impact of IT related solutions in an economic, social and environment context.
11. An ability to work in competitive environment like industry, cooperate.
12. An ability to do research work in cutting edge technology.

Elective – I
ECEE-4131: Advanced Digital System Design
ECEE-4132: Advanced Communication Networks
ECEE-4133: Programming language for Embedded Software
ECEE-4134: Microprocessors and Microcontrollers
ECEE-4135: Embedded Systems

Elective – II
ECEE-4141: MOS-VLSI Circuit Design
ECEE-4142: DC Analysis for MOS transistor
ECEE-4143: Remote Sensing
ECEE-4144: Physics of Semiconductor Devices
ECEE-4145: Computer Vision

Elective – III
ECEE 4231: Biomedical Signal Processing
ECEE 4232: Multispectral Signal Analysis
ECEE 4233: CMOS Analog IC design
ECEE 4234: RTL Simulation and Synthesis with PLD
ECEE 4235: FPGA Design

Elective – IV

ECEE-4241: Artificial Intelligence

ECEE-4242: Advanced Computer Architecture

ECEE-4243: Cognitive Radio

ECEE-4244: VLSI Testing and Testability

ECEE-4245: Low Power VLSI Design

Elective – V

ECEE-5111: Pattern Recognition and Machine Learning

ECEE-5112: MIMO System

ECEE-5113: Biomedical Image Processing

ECEE-5114: Wireless Sensors and Networks

ECEE-5115: Digital Image and Video Processing

Open Elective

ECE0 5120- Fundamentals of Electronics and Communications

ECEC-411: Advanced Digital Signal Processing

Course Outcomes:

At the end of this course, students will be able to
- Learn different techniques for filter design.
- Understanding of sampling techniques.
- Understanding of linear filters.
- Understand the techniques for various adaptive filtering .
- Study techniques for DSP in one dimensional signal analysis.

Syllabus Contents:

Unit-1
Overview of DSP, Characterization in time and frequency, FFT Algorithms, Digital filter design and structures: Basic FIR/IIR filter design &structures, design techniques of linear phase FIR filters, IIR filters by impulse invariance, bilinear transformation, FIR/IIR Cascaded lattice structures, and Parallel all pass realization of IIR.

Unit-2
Multi rate DSP, Decimators and Interpolators, Sampling rate conversion, multistage decimator & interpolator, poly phase filters, QMF, digital filter banks, Applications in subband coding.

Unit-3
Linear prediction & optimum linear filters, stationary random process, forward-backward linear prediction filters, solution of normal equations, AR Lattice and ARMA Lattice-Ladder Filters, Wiener Filters for Filtering and Prediction.

Unit-4
Adaptive Filters, Applications, Gradient Adaptive Lattice, Minimum mean square criterion, LMS algorithm, Recursive Least Square algorithm.

Unit-5
Estimation of Spectra from Finite-Duration Observations of Signals. Nonparametric Methods for Power Spectrum Estimation, Parametric Methods for Power Spectrum Estimation, Minimum- Variance Spectral Estimation, Eigen analysis Algorithms for Spectrum Estimation.

- D.G.Manolakis, V.K. Ingle and S.M.Kogon, "Statistical and Adaptive Signal Processing",   McGraw Hill, 2000.

ECEC-412: Wireless and Mobile Communications

Course Outcomes:

At the end of this course, students will be able to

- Design appropriate mobile communication systems.
- Apply frequency-reuse concept in mobile communications, and to analyze its effects on interference, system capacity, handoff techniques
- Distinguish various multiple-access techniques for mobile communications e.g. FDMA, TDMA, CDMA, and their advantages and disadvantages.
- Analyze path loss and interference for wireless telephony and their influences on a mobile-communication system's performance.
- Analyze and design CDMA system functioning with knowledge of forward and reverse channel details, Understanding upcoming technologies like 3G, 4G etc.

Syllabus Contents:

Unit-1

Cellular Communication Fundamentals: Cellular system design, Frequency reuse, cell splitting, handover concepts, Co channel and adjacent channel interference, interference reduction techniques and methods to improve cell coverage, Frequency management and channel assignment.GSM architecture and interfaces, GSM architecture details, GSM subsystems, GSM Logical Channels, Data Encryption in GSM, Mobility Management, Call Flows in GSM.2.5 G Standards: High speed Circuit Switched Data (HSCSD), General Packet Radio Service (GPRS), 2.75 G Standards: EDGE.

Unit-2

Spectral efficiency analysis based on calculations for Multiple access technologies: TDMA, FDMA and CDMA, Comparison of these technologies based on their signal separation techniques, advantages, disadvantages and application areas. Wireless network planning (Link budget and power spectrum calculations)

Unit-3

Mobile Radio Propagation: Large Scale Path Loss, Free Space Propagation Model, Reflection, Ground Reflection (Two-Ray) Model, Diffraction, Scattering, Practical Link Budget Design using Path Loss Models, Outdoor Propagation Models, Indoor Propagation Models, Signal Penetration into Buildings. Small Scale Fading and Multipath Propagation, Impulse Response Model, Multipath Measurements, Parameters of Multipath channels, Types of Small Scale Fading: Time Delay Spread; Flat, Frequency selective, Doppler Spread; Fast and Slow fading.

Unit-4

Equalization, Diversity: Equalizers in a communications receiver, Algorithms for adaptive equalization, diversity techniques, space, polarization, frequency diversity, Interleaving.

Unit-5
Code Division Multiple Access: Introduction to CDMA technology, IS 95 system Architecture, Higher Generation Cellular Standards:3G Standards: evolved EDGE, enhancements in 4G standard, Architecture and representative protocols, call flow for LTE, VoLTE, UMTS, introduction to 5G

Text Book and References:
- V.K. Garg, J.E. Wilkes, "Principle and Application of GSM", Pearson Education, 5th edition, 2008.   - V.K. Garg, "IS-95 CDMA & CDMA 2000", Pearson Education, 4 th edition, 2009.   - T.S. Rappaport, "Wireless Communications Principles and Practice", 2 nd edition, PHI,2002.   - William C.Y.Lee, "Mobile Cellular Telecommunications Analog and Digital Systems", 2nd edition, TMH, 1995.   - Asha Mehrotra, "A GSM system Engineering" Artech House Publishers Bosten, London,1997.

ECEA-415: Research Methodology and IPR
Course Outcomes: At the end of this course, students will be able to   - Understand research problem formulation.   - Analyze research related information   - Understand that today's world is controlled by Computer, Information Technology, but tomorrow world will be ruled by ideas, concept, and creativity.   - Understand that IPR protection provides an incentive to inventors for further research   - work and investment in R & D, which leads to creation of new and better products, and in turn brings about, economic growth and social benefits
Syllabus Contents: **Unit-1** Meaning of research problem, Sources of research problem, Criteria Characteristics of a good research problem, Errors in selecting a research problem, Scope and objectives of research problem. Approaches of investigation of solutions for research problem, data collection, analysis, interpretation, Necessary instrumentations **Unit-2** Effective literature studies approaches, analysis Plagiarism, Research ethics. **Unit-3** Effective technical writing, how to write report, Paper Developing a Research Proposal, Format of research proposal, a presentation and assessment by a review committee. **Unit-4** Nature of Intellectual Property: Patents, Designs, Trademarks and Copyright. Process

of Patenting and Development: technological research, innovation, patenting, development International Scenario: International cooperation on Intellectual Property. Procedure for grants of patents, Patenting under PCT.

Unit-5
Patent Rights: Scope of Patent Rights. Licensing and transfer of technology. Patent information and databases. Geographical Indications.

Unit-6
New Developments in IPR: Administration of Patent System. New developments in IPR; IPR of Biological Systems, Computer Software etc. Traditional knowledge Case Studies, IPR and IITs.

ELECTIVE -I

ECEE-4131: Advanced Digital System Design

Course Outcomes:

At the end of this course, students will be able to
- Understand the combinational and sequential circuit logic.
- Learn the different technique to realize the sequential circuit from the Boolean equation.
- Understanding of design procedure of logic circuits.
- Learn the realization of state machine using mealy and moore machine.
- Study the basics of verilog HDL for both combinational and sequential circuits.

Syllabus Contents:

Unit-1

Introductory concepts of Basic logic gates, Decoders, Encoders, Multiplexers, Implementing functions using Multiplexers, Demultiplexers, half adder, full adder, half subtractor, full subtractor, Parity Generators and Checkers, Signed Binary Arithmetic, ripple carry adders , BCD adders, carry look ahead adder.

Unit-2

Introduction to sequential circuits, latch, flip-flop, Synchronous and Asynchronous Digital Counters and shift registers, Mealy machine, Moore machine, State diagrams, State table minimization, realization of Mealy and Moore machine.

Unit-3

State transition table- state assignment for FPGAs, Algorithmic State Machine Charts, Derivation of ASM Charts, Realization of ASM charts, linked state machines, Implementation of Binary Multiplier, dice game controller.

Unit-4

Basic concepts, Programming technologies, Programmable Logic Element (PLE), Programmable Logic Array(PLA), Programmable Array Logic (PAL), Structure of standard PLDs, complex PLDs (CPLD). Design of combinational and sequential circuits using PLD's, Introduction to Field Programmable Gate Arrays-types of FPGA- XILINX XC 3000 series and 4000 series.

Unit-5

Basic Concepts: Design Methodology, Data Objects, Data Types, Operators, Concurrent and Sequential Assignment Statements, Gate level modelling, Data flow modelling, Behavioral level modelling.

Text Book and References:

- William J Dally and John W Poulton, Digital Systems Engineering, Cambridge University Press, 1998.
- Jayaram Bhaskar A, VHDL Primer, Prentice-Hall India,1999.

ECEE-4132: Advanced Communication Networks

Course Outcomes:

At the end of this course, students will be able to
- Understand advanced concepts in Communication Networking.
- Design and develop protocols for Communication Networks.
- Understand the mechanisms in Quality of Service in networking.
- Optimise the Network Design.
- Understand engineering issues in MPLS

Syllabus Contents :

Unit-1
Overview of Internet-Concepts, challenges and history. Overview of -ATM. TCP/IP Congestion and Flow Control in Internet-Throughput analysis of TCP congestion control, TCP for high bandwidth delay networks, Fairness issues in TCP.

Unit-2
Real Time Communications over Internet, Adaptive applications, Latency and throughput issues, Integrated Services Model (intServ), Resource reservation in Internet, RSVP, Characterization of Traffic by Linearly Bounded Arrival   Processes (LBAP), Leaky bucket algorithm and its properties.

Unit-3
Packet Scheduling, Algorithms-requirements and choices, Scheduling guaranteed service connections, GPS, WFQ and Rate proportional algorithms, High speed scheduler design, Theory of Latency Rate servers and delay bounds in packet switched networks for LBAP traffic, Active Queue Management – RED, WRED and Virtual clock, Control theoretic analysis of active queue management.

Unit-4
IP address lookup-challenges, Packet classification algorithms and Flow Identification-Grid of Tries, cross product and controlled prefix expansion algorithms, Admission control in Internet, Concept of Effective bandwidth, Measurement based admission control,

Differentiated Services in Internet (DiffServ), DiffServ architecture and framework.

Unit-5

IPV4, IPV6, IP tunnelling, IP switching and MPLS, Overview of IP over ATM and its evolution to IP switching, MPLS architecture and framework. MPLS Protocols, Traffic engineering issues in MPLS.

Text Book and References:

- Jean Wairand and Pravin Varaiya, "High Performance Communications Networks", 2nd edition, 2000.

ECEE-4133: Programming Languages for Embedded System

Course Outcomes:

At the end of this course, students will be able to

- Write an embedded C application of moderate complexity.
- Develop and analyze algorithms in C++.
- Differentiate interpreted languages from compiled languages.
- Brief knowledge of overloading.
- Brief knowledge of template and exceptional handling.

Syllabus Contents:

Unit-1

Embedded 'C' Programming: Bitwise operations, Dynamic memory allocation, OS services, Linked stack and queue, Sparse matrices, Binary tree, Interrupt handling in C, Code optimization issues, Writing LCD drives, Drivers for serial port communication, Embedded Software Development Cycle and Methods (Waterfall, Agile).

Unit-2

Object Oriented Programming: Introduction to procedural, modular, object-oriented and generic programming techniques, Limitations of procedural programming, objects, classes, data members, methods, data encapsulation, data abstraction and information hiding, inheritance, polymorphism.

Unit-3

CPP Programming: 'cin', 'cout', formatting and I/O manipulators, new and delete operators, Defining a class, data members and methods, 'this' pointer, constructors, destructors, friend function, dynamic memory allocation.

Unit-4

Overloading and Inheritance: Need of operator overloading, overloading the assignment, overloading using friends, type conversions, single inheritance, base and derived classes, friend classes, types of inheritance, hybrid inheritance, multiple inheritance, virtual base class, polymorphism, virtual functions.

Unit-5

Templates: Function template and class template, member function templates and template arguments, Exception Handling: syntax for exception handling code: try-catch- throw, Multiple Exceptions.

Text Book and References:

ECEE-4134: Microprocessors and Microcontrollers

Course Outcomes:

At the end of this course, students will be able to

- Write an Assembly Language Programming for 8086 and 80386.
- Understand the interfacing of different peripheral.
- Understand the different memory organization.
- Understand the difference between Microprocessor and Microcontroller.
- Design a system based on microcontroller

Syllabus Contents:

Unit-1
History of Microprocessor, Pin diagram, Block Diagram, Minimum and Maximum Mode and Bus Timings, Ready and Wait states and 8086 based micro-computing system, Machine language instruction formats, Addressing modes, Instruction set, Assembler directives.

Unit-2
ALP, programming with an assembler, stack structure, Interrupts, Service subroutines and Interrupt programming and Macros.

Unit-3
Memory Interfacing (DRAM), PPI- Modes of operation of 8255, interfacing to ADC & DAC Programmable timer- 8253, PIC 8259A, USART and their interfacing.

Unit-4
Architectural and features of 80386, additional instructions of 80386, Data types of 80386, thread, multithreading, Pipeline, Architectural and features of 80486, Difference between 80386 and 80486.

Unit-5
Introduction to Intel 8-bit and 16-bit Micro controllers, 8051-Architecture, memory organization, Addressing modes. Instruction formats, Instruction sets, Interrupt structure and interrupt priorities, Port structures and Different modes of operation and programming Examples.

Text Book and References:
- "The Intel Microprocessors", Architecture, Programming and interfacing by Barry B. Brey
- 8086 Micro Processors by Kenrith J Ayala, Thomson Publishers.
- Microcontrollers by K.J.Ayala - Thomson Publishers.
- Micro Processors and Interfacing Programming and Hardware by Douglas V. Hall.
- The 8088 and 8086 Microprocessor- W.A. Triebel & Avtar Singh- PHI, 4th Edn, 2002.

ECEE-4135: Embedded System

Course Outcomes:

At the end of this course, students will be able to
- Understand the interfacing circuits for controlling.
- Understand the internal processor design.
- Write program for embedded C.
- Interface many peripheral.
- Built minor project base on microcontroller.

Syllabus Contents:

Unit-1

Operational Amplifier and Analog Signal Processing Circuits: Introduction, Voltage Follower Circuit, Inverting Amplifier, Sign Changer, Phase Shifter, Inverting Summing Amplifier, Non-inverting Amplifier, Non-inverting Summing Amplifier, Difference Amplifier, Current to Voltage (I-V) Converter, Integrator, Differentiator, Comparators and Schmitt Triggers.

Unit-2
Embedded Processors: ISA Architecture Models, Internal Processor Design, Processor

Performance, Reading a Processor's Datasheet. Board Memory: Read-Only Memory (ROM), Random-Access Memory (RAM), Auxiliary Memory, Memory Management of External Memory, Board Memory and Performance.

Unit-3
Board I/O (Input/Output): Managing Data: Serial vs. Parallel I/O, Interfacing the I/O Components, I/O and Performance. Board Buses: Bus Arbitration and Timing, Integrating the Bus with Other Board Components, Bus Performance.

Unit-4
Embedded C: C Statements, Structures, Operations, Data Type, Bit Operation, Control Statement, Looping, Data modifier.

Unit-5
Design Concept: Embedded Microcontroller Based DC Motor Control, Embedded Microcontroller Based Switched Mode Power Supply, Embedded Microcontroller Based Magnetic Levitation.

Text Book and References:

- An Embedded Software Primer by David E. Simon, Addison Wesley.
- The Art of Designing Embedded Systems by Jack Ganssle, Newnes

ELECTIVE-II

ECEE-4141: MOS-VLSI Circuit Design

Course Outcomes:

At the end of this course, students will be able to

- Understand realization of digital logic using CMOS.

- Understand the physics of MOSFET.

- Learn the analysis of static and dynamic power dissipation of circuits.

- Learn the concept of digital switches

- Design the VLSI circuit.

Syllabus Contents:

Unit-1

Classification of CMOS digital circuits and Circuit design, Overview of VLSI design methodologies, VLSI design flow, Design hierarchy and concepts, VLSI design styles, Design quality, Packing technology, CAD technology, Fabrication process flow, CMOS n-well process, layout design rules.

Unit-2

MOS structure, MOS system under external bias, structure and operation of MOS transistor, MOSFET current/voltage characteristics, MOSFET scaling and small-geometry effects, MOSFET capacitances, Modeling of MOS transistor using SPICE.

Unit-3

Introduction, Resistive-Load Inverter, Inverter with n-type MOSFET load, CMOS Inverter, Delay-Time Definitions, Calculation of Delay Times, Inverter Design with Delay Constraints, Estimation of Interconnect Parasitics, Calculation of Interconnect Delay, Switching Power Dissipation of CMOS Inverters.

Unit-4

Introduction, MOS logic circuits with depletion nMOS loads, CMOS logic Circuits, Complex logic circuits, CMOS transmission gates (Pass gates), Behavior of bistable elements, SR latch circuit, clocked latch and flip-flop circuits, CMOS D-latch and Edge-triggered flip-flop.

Unit-5

Basic principles of pass transistor circuits, voltage bootstrapping, synchronous dynamic circuit techniques, Dynamic CMOS circuit techniques, High performance dynamic CMOS circuits.

Text Book and References:

VLSI Circuits and Systems" – PHI, EEE, 2005 Edition.

ECEE-4142: DC Analysis for MOS Transistor

Course Outcomes:

At the end of this course, students will be able to
- Understand working principle of MOS transistor.
- Learn the Modeling of MOS transistor.
- Learn the short channel effect in MOS transistor.
- Learn the concept of field inversion.
- Learn the problems in MOS modelling.

Syllabus Contents:

Unit-1
Introduction, semiconductors, equilibrium in absence of electric field, equilibrium in presence of electric field, Non-equilibrium : Quasi Fermi Level, Poisson's equation, the P-N Junction, Overview of MOS Transistor

Unit-2
Introduction, Flat-band voltage, potential balance and charge balance, effect of Gate body voltage on surface condition, Accumulation, Depletion and Inversion, Small Signal Capacitance

Unit-3
Introduction, Contacting the inversion layer, the Body effect, Regions of inversion: Strong, weak and moderate inversion, A "Vcb control" point of view: fundamental, Pinch- off voltage , Uses of three terminal MOS structure

Unit-4
Introduction, transistor regions of operation, complete all region models, simplified all regions model, model based on quasi-fermi potentials, regions of inversion in terms of terminal voltages, Strong inversion: Complete Strong inversion model, body referenced strong inversion model, source referenced simplified strong inversion model, weak inversion: special conditions in weak inversion, body and source referenced models, moderate inversion and Single piece model.

Unit-5
Introduction, Carrier velocity saturation, channel length modulation, charge sharing, DIBL, Punch through, combining small dimension effects into one model, Hot carrier effects, impact ionization, Velocity overshoot and Ballistic operation, quantum mechanical effects.

Text Book and References:
- Yannis T., Colin M., "Operation and modeling of the NOS Transistor". 3rd Edition, Oxford University Press (2010).

ECEE-4143: Remote Sensing

Course Outcomes:

At the end of this course, students shall be able to
- Understand basic concepts, principles and applications of remote sensing on the geometric.
- Understand basic concepts, principles and applications of remote sensing on radiometric principles.
- Provide examples of applications of principles to a variety of topics in remote sensing, particularly related to data collection, radiation, resolution, and sampling.
- Understand the various sensing remote sensing techniques.
- Understand the various scattering system systems.

Syllabus Contents:

Unit 1
Physics Of Remote Sensing: Electro Magnetic Spectrum, Physics of Remote Sensing-Effects of Atmosphere Scattering, Different types, Absorption, Atmospheric window, Energy interaction with surface features, Spectral reflectance of vegetation, soil and water atmospheric influence on spectral response patterns-multi concept in Remote sensing.

Unit 2
Data Acquisition: Types of Platforms–different types of aircrafts-Manned and Unmanned space crafts, sun synchronous and geo synchronous satellites, Types and characteristics of different platforms ,LANDSAT, SPOT, IRS, INSAT, IKONOS, QUICKBIRD etc.

Unit 3

Photographic products, B/W, color, color IR film and their characteristics, resolving power of lens and film, Optomechanical electro optical sensors, across track and along track scanners multispectral scanners and thermal scanners–geometric characteristics of scanner imagery calibration of thermal scanners.

Unit 4
Scattering System: Microwave scatterometry, types of RADAR, SLAR resolution range and azimuth real aperture and synthetic aperture RADAR. Characteristics of Microwave image stopographic effect-different types of Remote Sensing platforms airborne and space borne sensors ERS, JERS, RADARSAT, RISAT, Scatterometer, Altimeter, LiDAR remote sensing, principles, applications.

Unit 5
Thermal And Hyper Spectral Remote Sensing: Sensors characteristics-principle of spectroscopy imaging, spectroscopy field conditions, compound spectral curve, Spectral library, radiative models, processing procedures, derivative spectrometry, thermal remote sensing ,thermal sensors, principles, thermal data processing, applications.

ECEE-4144: Physics of Semiconductor Devices

Course Outcomes:

At the end of this course, students will be able to
- Understand the basic of Quantum Mechanics.
- Understand the Quantum Theory of Solids.
- Understand the Energy equilibrium for semiconductors.
- Understand the characteristic of Semiconductor Junction
- Understand the Physic of MOS.

Syllabus Contents:

Unit-1

Introduction to Quantum Mechanics: Principles of Quantum Mechanics, Schrodinger's Wave Equation, Applications of Schrodinger's Wave Equation, Extensions of the Wave Theory to Atoms.

Unit-2

Introduction to the Quantum Theory of Solids: Allowed and Forbidden Energy Bands, Electrical Conduction in Solids, Extension to Three Dimensions, Density of States Function, Statistical Mechanics.

Unit-3

The Semiconductor in Equilibrium: Charge Carriers in Semiconductors, Dopant Atoms and Energy Levels, The Extrinsic Semiconductor, Statistics of Donors and Acceptors, Charge Neutrality, Position of Fermi Energy Level, Carrier Drift, Carrier Diffusion, Graded Impurity Distribution.

Unit-4

The pn Junction: Basic Structure of the pn Junction, Zero Applied Bias, Reverse Applied Bias, Non-uniformly Doped Junctions, pn Junction Current, Small-Signal Model of the pn Junction, Generation-Recombination Currents, Junction Breakdown, Charge Storage and Diode Transients

Unit-5

MOSFET Characteristics: Threshold Voltage, Current-Voltage Characteristics, p-Channel MOSFETs, MOSFET Capacitances, Junction Leakage Currents, Parasitic Resistances, Scaling Theory, Short-Channel Effects, Narrow-Width Threshold Voltage, Hot Electrons.

Text Book and References:
- Semiconductor Physics and Devices by Donald A. Neamen, McGraw-Hill Higher-Education.
- CIRCUIT DESIGN for CMOS VLSI by John P. Uyemura, Springer Science Business Media, LLC
- Semiconductor Device Physics and Design By Umesh K. Mishra And Jasprit Singh, Springer.

ECEE-4145: Computer Vision

Course Outcomes:

At the end of this course, students will be able to
- Study the image formation models for computer vision.
- Study the feature extraction for computer vision.
- Knowledge representation for computer vision.
- Identify the segmentation and motion detection and estimation techniques.
- Develop small applications and detect the objects in various applications.

Syllabus Contents:

Unit-1
Image Formation Models
Monocular imaging system, Orthographic & Perspective Projection, Camera model and Camera calibration, Binocular imaging systems, Perspective, Binocular Stereopsis: Camera and Epipolar Geometry; Homography, Rectification, DLT, RANSAC, 3-D reconstruction framework; Auto-calibration. Apparel, Binocular Stereopsis: Camera and Epipolar Geometry; Homography, Rectification, DLT, RANSAC, 3-D reconstruction framework; Auto calibration. Apparel, Stereo vision.

Unit-2
Feature Extraction
Image representations (continuous and discrete), Edge detection, Edge linking, corner detection, texture, binary shape analysis, boundary pattern analysis, circle and ellipse detection, Light at Surfaces; Phong Model; Reflectance Map; Albedo estimation; Photometric Stereo; Use of Surface Smoothness Constraint; Shape from Texture, color, motion and edges.

Unit-3
Shape Representation and Segmentation
Deformable curves and surfaces, Snakes and active contours, Level set representations, Fourier and wavelet descriptors, Medial representations, Multi-resolution analysis, Region Growing, Edge Based approaches to segmentation, Graph-Cut, Mean-Shift, MRFs, Texture Segmentation.

Unit-4
Motion Detection and Estimation
Regularization theory, Optical computation, Stereo Vision, Motion estimation, Background Subtraction and Modeling, Optical Flow, KLT, Spatio-Temporal Analysis, Dynamic Stereo; Motion parameter estimation, Structure from motion, Motion Tracking in Video.

Unit-5
Object recognition
Hough transforms and other simple object recognition methods, Shape correspondence and shape matching, Principal component analysis, Shape priors for recognition. Applications of Computer Vision

ECEC-421: Information Theory and Coding
Course Outcomes:
At the end of this course, students will be able to: - Design the channel performance using information theory.   - Comprehend various error control properties.   - Apply linear block codes for error detection and correction.   - Apply convolution codes for performance analysis & cyclic codes for error detection and correction.   - Design BCH & RS codes for channel performance improvement against burst errors.
Syllabus Contents: **Unit-1** Source Coding - Introduction to information theory, uncertainty and information, average mutual information and entropy, source coding theorem, Shannon-fano coding, Huffman coding, Adaptive Huffman coding, Arithmetic coding, Lempel-Ziv algorithm, run-length encoding and rate distortion function. **Unit-2** Channel capacity and coding - channel models, channel capacity, channel coding, information capacity theorem, random selection of codes. Error control coding: linear block codes and their properties, decoding of linear block code, perfect codes, hamming codes, optimal linear codes and MDS codes.

Unit-3

Cyclic codes - polynomials, division algorithm for polynomials, a method for generating cyclic codes, matrix description of cyclic codes, burst error correction, fire codes, golay codes, CRC codes, circuit implementation of cyclic codes. BCH codes: minimal polynomials, generator polynomial for BCH codes, decoding of BCH codes, Reed-Solomon codes and nested codes.

Unit-4

Convolutional codes - tree codes and trellis codes, polynomial description of convolutional codes, distance notions for convolutional codes, generation function, matrix description of convolutional codes, viterbi decoding of convolutional codes, distance bounds for convolutional codes, turbo codes and turbo decoding.

Unit-5

Trellis Coded Modulation - concept of coded modulation, mapping by set partitioning, ungerboeck's TCM design rules, TCM decoder, Performance evaluation for Additive White Gaussian Noise (AWGN) channel, TCM for fading channels.

ECEC-422: MEMS and Microsystems

Course Outcomes:

At the end of this course, students will be able to
- Understand the semiconductor based MEMS Devices.
- Understand the working principle of MEMS devices.
- Learn the various types of actuators and sensors.
- Learn the modelling and simulation of MEMS Devices.
- Understand the MEMS interfacing Circuit.

Syllabus Contents:

Unit 1

Introduction to MEMS, Micro-System; Evolution of Micro-System; Integrated Microsystem: Micromechanical Structure; Micro-Sensor, Micro-Actuator, Sensor Characteristic; Physical Principle of Sensing; Application of Smart Material and Microsystem.

Unit 2

MEMS Materials and their Preparation: Overview, Atomic Structure and the Periodic Table, Atomic Bonding, Crystallinity; Metals: Physical and Chemical Properties, Metallization, Semiconductors: Semiconductors: Electrical and Chemical Properties, Semiconductors: Growth and Deposition; Ceramic, Polymeric, and Composite Materials.

Unit 3

Microsystem: Silicon Capacitive Accelerometer, Piezoresistive Pressure Sensor, Conductometric Gas Sensor, Electrostatic Comb Drive, Magnetic Microrelay, Smart Material: Thermoresponsive Material, Piezoelectric Material, Electrostatic/ Electromagnetic Material, Rheological Material, Electrochromic Material, Biomimetic Material, Smart Gel.

Unit 4

Mechanics of beam and diaphragm structures: Stress and Strain; Stress and Strain of Beam Structures; Vibration Frequency by Energy Method; Vibration Modes and the Buckling of a Beam; Damped and forced vibration; Basic Mechanics of Diaphragms.

Unit 5

Electronics Circuit and Control for Micro and Smart System: Semiconductor Devices; Electronics Amplifier; Practical Signal Conditioning Circuit for Microsystem; Circuit for Conditioning Sensed Signal; Introduction to control System.

ELECTIVE-III

ECEE-4231: Biomedical Signal Processing

Course Outcomes:

At the end of this course, students will be able to
- Understand different types of biomedical signal.
- Understand the data acquisition for various biomedical signal.
- Identify and analyze different biomedical signals.
- Find applications related to biomedical signal processing
- Understand the various signal processing techniques.

Syllabus Contents:

Unit 1
Acquisition, Generation of Bio-signals, Origin of bio-signals, Types of bio-signals, Study of diagnostically significant bio-signal parameters

Unit 2
Electrodes for bio-physiological sensing and conditioning, Electrode-electrolyte interface, polarization, electrode skin interface and motion artefact, biomaterial used for electrode, Types of electrodes (body surface, internal, array of electrodes, microelectrodes), Practical aspects of using electrodes, Acquisition of bio-signals (signal conditioning) and Signal conversion (ADC's DAC's) Processing, Digital filtering

Unit 3
Biomedical signal processing by Fourier analysis, Biomedical signal processing by wavelet (time frequency) analysis, Analysis (Computation of signal parameters that are diagnostically significant)

Unit 4
Classification of signals and noise, Spectral analysis of deterministic, stationary random signals and non-stationary signals, Coherent treatment of various biomedical signal processing methods and applications.

Unit 5
Principal component analysis, Correlation and regression, Analysis of chaotic signals Application areas of Bio–Signals analysis Multiresolution analysis (MRA) and wavelets, Principal component analysis(PCA), Independent component analysis(ICA).introduction to Neural Networks.

Text Book and References:
- W. J. Tompkins, "Biomedical Digital Signal Processing", Prentice Hall, 1993.

ECEE-4232: Multispectral Signal Analysis

Course Outcomes:

At the end of this course, students will be able to
- Select appropriate hyper spectral data for a particular application.
- Understand basic concepts of data acquisition and image processing tasks required for multi and hyper spectral data analysis.
- Learn techniques for classification and analysis of multi and hyper spectral data.
- Learn the different algorithm for multispectral signal analysis.
- Learn the basic concept of machine learning algorithm for multispectral signal analysis.

Syllabus Contents:

Unit 1
Hyperspectral Sensors and Applications: Introduction, Multi-spectral Scanning Systems (MSS), Hyperspectral Systems, Airborne sensors, Spaceborne sensors, Ground Spectroscopy, Software for Hyperspectral Processing, Applications, Atmosphere and Hydrosphere, Vegetation, Soils and Geology, Environmental Hazards and Anthropogenic Activity.

Unit 2
Overview of Image Processing: Introduction, Image File Formats, Image Distortion and Rectification, Radiometric Distortion, Geometric Distortion and Rectification, Image Registration, Image Enhancement, Point Operations, Geometric Operation, Image Classification, Supervised Classification, Unsupervised Classification, Crisp Classification Algorithms, Fuzzy Classification Algorithms, Classification Accuracy Assessment, Image Change Detection, Image Fusion, Automatic Target Recognition.

Unit 3
Mutual Information: A Similarity Measure for Intensity Based Image Registration: Introduction, Mutual Information Similarity Measure, Joint Histogram Estimation Methods, Two-Step Joint Histogram Estimation, One-Step Joint Histogram Estimation, Interpolation Induced Artifacts, Generalized Partial Volume Estimation of Joint Histograms, Optimization Issues in the Maximization of MI.

Unit 4
Independent Component Analysis: Introduction, Concept of ICA, ICA Algorithms, Preprocessing using PCA, Information Minimization Solution for ICA, ICA Solution through Non-Gaussianity Maximization, Application of ICA to Hyperspectral Imagery, Feature Extraction Based Model, Linear Mixture Model Based Model, An ICA algorithm for Hyperspectral Image Processing, Applications using ICA.

Unit 5
Support Vector Machines : Introduction, Statistical Learning Theory, Empirical Risk Minimization, Structural Risk Minimization, Design of Support Vector Machines, Linearly Separable Case, Linearly Non-Separable Case, Non-Linear Support Vector Machines, SVMs for Multiclass Classification, One Against the Rest Classification, Pair wise Classification.

Text Book and References:

ECEE-4233: CMOS Analog IC Design

Course Outcomes:

At the end of this course, students will be able to
- Analyze, design, optimize and simulate analog circuits using CMOS constrained by the design metrics.
- Understand the MOS as switch.
- Understand the basic component of Operational Amplifier.
- Connect the individual CMOS to form the building blocks of an IC.
- Use EDA tools like Cadence, Synopsis and other open source software tools.

Syllabus Contents:

Unit – 1

The MOS Transistor, Passive components: resistor and Capacitor, CMOS device modeling, Model Parameters, Large Signal Model, Small signal Model, Sub-threshold MOS Model, Computer Simulation Model.

Unit – 2

MOS Switch, MOS Diode, MOS active resistor, Current sinks and sources Current Mirror with beta Helper, Current and Voltage references.

Unit-3

Switched Capacitor circuits: basic building blocks, Operation and Analysis, Non-ideal effects in switched capacitor circuits, Switched capacitor integrators, first order filters

Unit -4

Inverters, Differential Amplifiers, Cascode Amplifiers, Design of CMOS Op Amps, Compensation of Op Amps, Design of Two-Stage Op Amps, Power-Supply Rejection Ratio of Two-Stage Op Amps, Cascode Op Amps, Measurement Techniques of OP Amp.

Unit – 5

Two-Stage, Open-Loop Comparators, Other Open Loop Comparators, Improving the Performance of Open-Loop Comparators, Discrete-Time Comparators

ECEE-4234: RTL Simulation and Synthesis with PLD

Course Outcomes:

At the end of the course, students will demonstrate the ability to:
- Familiarity of Finite State Machines, RTL design using reconfigurable logic.
- Write the Hardware Descriptive Language for Logic Devices.
- Learn the concept of power optimization.
- Design and develop IP cores and Prototypes with performance guarantees.
- Use EDA tools like Cadence, Mentor Graphics and Xilinx.

Syllabus Contents:

Unit-1
Top down approach to design, Design of FSMs (Synchronous and asynchronous), Static timing analysis, Meta-stability, Clock issues, Need and design strategies for multi-clock domain designs.

Unit-2
Design entry by Verilog/VHDL/FSM, Verilog AMS.

Unit-3
Programmable Logic Devices, Introduction to ASIC Design Flow, FPGA, SoC, Floor Planning, Placement, Clock tree synthesis, Routing, Physical verification, Power analysis, ESD protection.

Unit-4
Design for performance, Low power VLSI design techniques. Design for testability.

Unit 5
IP and Prototyping: IP in various forms: RTL Source code, Encrypted Source code, Soft IP, Netlist, Physical IP, Use of external hard IP during prototyping

Text Book and References:
- Richard S. Sandige, "Modern Digital Design", MGH, International Editions.
- Donald D Givone, "Digital principles and Design", TMH

- Bob Zeidman, "Designing with FPGAs & CPLDs", CMP Books.

ECEE-4235: FPGA Design

Course Outcomes:

At the end of the course, students will demonstrate the ability to:
- Understand the different types of Programmable logic devices.
- Learn the working of principle of FPGA devices.
- Learn the implementation of algorithm of FPGA devices.
- Learn the optimization of FPGA.
- Learn the placement and routing of FPGA design.

Syllabus Contents:

Unit –1
Evolution of programmable devices: Introduction to AND-OR structured Programmable Logic Devices PROM, PLA, PAL and MPGAs; Combinational and sequential circuit realization using PROM based Programmable Logic Element (PLE); Architecture of FPAD, FPLA, FPLS and FPID devices.

Unit – 2
FPGA Technology: FPGA resources - Logic Blocks and Interconnection Resources; Economics and applications of FPGAs; Implementation Process for FPGAs Programming Technologies - Static RAM Programming, Anti Fuse Programming, EPROM and EEPROM Programming Technology; Commercially available FPGAs - Xilinx FPGAs, Altera FPGAs; FPGA Design Flow Example - Initial Design Entry, Translation to XNF Format, Partitioning, Place and Route, Performance Calculation and Design Verification.

Unit – 3
Technology Mapping for FPGAs: Logic Synthesis - Logic Optimization and Technology Mapping; Lookup Table Technology Mapping - Chortle-crf Technology Mapper, Chortle-d Technology Mapper, Lookup Table Technology Mapping in mis-pga, Lookup Table Technology Mapping in Asyl and Hydra Technology Mapper; Multiplexer Technology Mapping - Multiplexer Technology Mapping in mis-pga.

Unit – 4
Routing for FPGAs: Routing Terminology; Strategy for routing in FPGAs; Routing for Row-Logic Block Architecture: Logic Block Functionality versus Area-Efficiency - Logic Block Selection, Experimental Procedure, Logic Block Area and Routing Model and Results.

Unit – 5
Based FPGAs - Segmented channel routing, 1-channel routing algorithm, K – channel routing algorithm and results.

Text Book and References:
- FPGA-Based System Design by Wayne Wolf, Verlag: Prentice Hall
- Modern VLSI Design: System-on-Chip Design (3rd Edition) by Wayne Wolf, Verilog.
- A Verilog HDL primer by Jayaram Bhasker, Star Galaxy Pub.

ELECTIVE-IV

ECEC-4241: Artificial Intelligence

Course Outcomes:

At the end of this course, students will be able to
- Understand the different search technique.
- Understand the concept of Artificial Intelligence, search techniques and knowledge representation issues.
- Understand the statistical problem solving.
- Understanding reasoning and fuzzy logic for artificial intelligence.
- Understanding game playing and natural language processing.

Syllabus Contents:

Unit-1
Define AI (Artificial Intelligence), The AI Problems, The Underlying Assumption, AI Techniques, The Level Of The Model, Criteria For Success, Some General References, One Final Word Problems, State Space Search & Heuristic Search Techniques: Defining The Problems As A State Space Search, Production Systems, Production Characteristics, Production System Characteristics, And Issues In The Design Of Search Programs, Additional Problems. Generate-And-Test, Hill Climbing, Best-First Search, Problem Reduction, Constraint Satisfaction, Means- Ends Analysis.

Unit-2
Knowledge Representation Issues: Representations And Mappings, Approaches To Knowledge Representation. Using Predicate Logic: Representation Simple Facts In Logic, Representing Instance And Isa Relationships, Computable Functions And Predicates, Resolution. Representing Knowledge Using Rules: Procedural Versus Declarative Knowledge, Logic Programming, Forward Versus Backward Reasoning.

Unit-3
Symbolic Reasoning Under Uncertainty: Introduction To No monotonic Reasoning, Logics For Non-monotonic Reasoning. Statistical Reasoning: Probability And Bays' Theorem, Certainty Factors And Rule-Base Systems, Bayesian Networks, Dempster Shafer Theory

Unit-4
Fuzzy Logic. Weak Slot-and-Filler Structures: Semantic Nets, Frames. Strong Slot-and-Filler Structures: Conceptual Dependency, Scripts, CYC

Unit-5
Natural Language Processing: Introduction, Syntactic Processing, Semantic Analysis, Discourse & Pragmatic Processing, Spell Checking Connectionist Models: Introduction: Hopfield Network, Learning In Neural Network, Application Of Neural Networks, Recurrent Networks, Distributed Representations, Connectionist AI & Symbolic AI.

Text Book and References:
- Elaine Rich and Kevin Knight "Artificial Intelligence", 2nd Edition, Tata Mcgraw-Hill, 2005.
- Stuart Russel and Peter Norvig, "Artificial Intelligence: A Modern Approach", 3rd Edition, Prentice Hall, 2009.

ECEE-4242: Advanced Computer Architecture

Course Outcomes:

At the end of this course, students will be able to

- Understand parallelism and pipelining concepts, the design aspects and challenges.
- Understand the application of pipelining and parallelism.
- Evaluate the issues in vector and array processors.
- Understand the Architecture of Microprocessor.
- Study and analyze the high performance scalable multithreaded and multiprocessor systems.

Syllabus Contents:

Unit-1

Parallel Processing and Pipelining Processing- Architectural Classification, Applications of parallel processing, Instruction level Parallelism and Thread Level Parallelism, Explicitly Parallel Instruction Computing (EPIC) Architecture.

Unit-2

Pipeline Architecture-Principles and implementation of Pipelining, Classification of pipelining processors, Design aspect of Arithmetic and Instruction pipelining, Pipelining hazards and resolving techniques, Data buffering techniques, Advanced pipelining techniques, Software pipelining, VLIW (Very Long Instruction Word) processor.

Unit-3

Vector and Array Processor- Issues in Vector Processing, Vector performance modeling, SIMD Computer Organization, Static Vs Dynamic network, Parallel Algorithms for Array Processors: Matrix Multiplication.

Unit-4

Multiprocessor Architecture - Loosely and Tightly coupled multiprocessors, Inter Processor communication network, Time shared bus, Multiport Memory Model, Memory contention and arbitration techniques, Cache coherency and bus snooping, Massively Parallel Processors (MPP).

Unit-5

Multithreaded Architecture- Multithreaded processors, Latency hiding techniques, Principles of multithreading, Issues and solutions, Parallel Programming Techniques: Message passing program development.

Text Book and References:

ECEE-4243: Cognitive Radio

Course Outcomes:

At the end of this course, students will be able to
- Understand the fundamental concepts of cognitive radio networks.
- Develop the cognitive radio, as well as techniques for spectrum holes detection that
- Cognitive radio takes advantages in order to exploit it.
- Understand technologies to allow an efficient use of TVWS for radio communications based on two spectrum sharing business models/policies.
- Understand fundamental issues regarding dynamic spectrum access, the radio-resource management and trading, as well as a number of optimisation techniques for better spectrum exploitation

Syllabus Contents:

Unit 1
Basic SDR, Software and Hardware Architecture of an SDR, Spectrum Management – Managing unlicensed spectrum, Noise Aggregation.

Unit 2
Introduction Hardware and Software architecture, SDR development process and Design – Application software, Component development, Waveform development   cognitive waveform development.

Unit 3
Radio flexibility and capability, Aware, Adaptive, Comparison of Radio capabilities and properties Available Technologies, IEEE 802 Cognitive Radio related activities, Application.

Unit 4
Design Challenges associated with CR Hardware requirements, Hidden primary user problem detecting spread spectrum primary users sensing duration and frequency security.

Unit 5
Overview and Classification Matched filter , waveform based sensing , cyclostationary based sensing, Energy detector based sensing, Radio Identifier, Cooperative sensing- other sensing methods

Text Book and References:
- Paul Burns "Software Defined Radio for 3G" Artech House, 2002.

ECEE-4244: VLSI Testing and Testability

Course Outcomes:

At the end of the course, students will demonstrate the ability to:
- Understand the different types of faults in digital circuits
- Learn the ATPG algebra for both combinational and sequential circuits
- Learn the use of scan chain in digital circuit testing
- Learn the Ad-hoc design for testability.
- Understand the Architecture like BIST, LFSR etc.

Syllabus Contents:

Unit – 1

Physical Faults and their modelling: Stuck at Faults, Bridging Faults, Fault detection, Fault Equivalence, Fault Dominance, Fault Collapsing and Checkpoint Theorem, General fault simulation techniques serial, parallel, concurrent and deductive fault simulation, critical path tracing.

Unit – 2
Introduction to Automatic Test Pattern Generation (ATPG) and ATPG Algebras, ATPG for single stuck-at faults and multiple stuck-at faults.
Standard ATPG Algorithms**:** D-algorithm. Basics of PODEM and FAN.

Unit – 3
ATPG for Single-Clock Synchronous Circuits, Use of Nine-Valued Logic and Time-Frame Expansion Methods, Complexity of Sequential ATPG
Scan Chain based Sequential Circuit Testing**:** Scan Cell Design, Design variations of Scan Chains, Sequential Testing based on Scan Chains, Overheads of Scan Design.

Unit – 4
Ad-hoc design for testability- test points, Controllability and Observability of digital circuits , partial scan and full scan, serial and non-serial scan; boundary scan standard.

Unit-5
Built in Self test, Architecture of BIST, LFSR and Compaction Techniques, Memory Testing: Memory architecture, types of faults in memory and March Test

Text Book and References:
- Bushnell and V D Agarwal," Essential of Electronics Testing", Kluwer.
- Laung, Cheng and Xiaoqing" VLSI Test principles and architectures"Elsevier.

ECEE-4245: Low Power VLSI Design

Course Outcomes:

At the end of the course, students will be able to:
- Identify the sources of power dissipation in digital IC systems & understand the impact of power on system performance and reliability.
- Characterize and model power consumption & understand the basic analysis methods.
- Design techniques of low power circuit.
- Understand leakage sources and reduction techniques.
- Design Low power memory.

Syllabus Contents:

Unit-1
Technology & Circuit Design Levels: Sources of power dissipation in digital ICs, degree of freedom, recurring themes in low-power, emerging low power approaches, dynamic dissipation in CMOS, effects of V_{dd} & V_t on speed, constraints on V_t reduction, transistor sizing & optimal gate oxide thickness, impact of technology scaling, technology innovations.

Unit-2
Low Power Circuit Techniques: Power consumption in circuits, flip-flops & latches, high capacitance nodes, energy recovery, reversible pipelines, high performance approaches.

Unit-3
Low Power Clock Distribution: Power dissipation in clock distribution, single driver Versus distributed buffers, buffers & device sizing under process variations, zero skew Vs. Tolerable skew, chip & package co-design of clock network.

Unit-4
Logic Synthesis for Low Power estimation techniques: Power minimization techniques, low power arithmetic components- circuit design styles, adders, multipliers.

Unit-5
Low Power Memory Design: Sources & reduction of power dissipation in memory subsystem, sources of power dissipation in DRAM & SRAM, low power DRAM circuits, low power SRAM circuits.

Text Book and References:

ELECTIVE-V

ECEE-5111: Pattern Recognition & Machine Learning
Course Outcomes: At the end of this course, students will be able to • Understand the pattern recognition. • Study the parametric and linear models for classification. • Design neural network and SVM for classification. • Understand different algorithm and procedure used in pattern recognition. • Develop machine independent and unsupervised learning techniques.
Syllabus Contents: **Unit-1** Introduction to Pattern Recognition : Problems, applications, design cycle, learning and Adaptation, examples, Probability Distributions, Parametric Learning, Maximum likelihood and Bayesian Decision Theory- Bayes rule, discriminant functions, loss functions and Bayesian error analysis. **Unit-2** Linear models: Linear Models for Regression, linear regression, logistic regression Linear Models for Classification. **Unit-3** Neural Network: perceptron, multi-layer perceptron, back propagation algorithm, error surfaces, practical techniques for improving back propagation, additional networks and training methods, Adaboost, Deep Learning. **Unit-4** Linear discriminant functions, decision surfaces, two category, multi category, minimum squared error procedures, the Ho-Kashyap procedures, linear programming algorithms, Support vector machine. **Unit-5** Algorithm independent machine learning, lack of inherent superiority of any classifier, bias and variance, re-sampling for classifier design, combining classifiers. Unsupervised learning and clustering k-means clustering, fuzzy k-means clustering, hierarchical clustering
Text Book and References: • Richard O. Duda, Peter E. Hart, David G. Stork, "Pattern Classification", 2nd Edition John Wiley & Sons, 2001. • Trevor Hastie, Robert Tibshirani, Jerome H. Friedman, "The Elements of StatisticalLearning", 2nd Edition, Springer, 2009. • C. Bishop, "Pattern Recognition and Machine Learning", Springer, 2006.

ECEE-5112 : MIMO System

Course Outcomes:
At the end of this course, students will be able to
- Understand channel modelling and propagation, multi-user Communications,
- Understand MIMO Capacity, space-time coding, MIMO receivers
- Understand , MIMO for multi-carrier systems (e.g. MIMO-OFDM),
- Understand cooperative and coordinated multi-cell MIMO.
- Perform Mathematical modelling and analysis of MIMO systems.

Syllabus Contents :

Unit-1

Introduction to Multi-antenna Systems, Motivation, Types of multi-antenna systems, MIMO vs. multi-antenna systems. Diversity, Exploiting multipath diversity, Transmit diversity, Space-time codes, The Alamouti scheme, Delay diversity, Cyclic delay diversity, Space-frequency codes, Receive diversity, The rake receiver, Combining techniques, Spatial Multiplexing, Spectral efficiency and capacity, Transmitting independent streams in parallel, Mathematical notation.

Unit-2

The generic MIMO problem, Singular Value Decomposition, Eigen values and eigenvectors, Equalising MIMO systems, Disadvantages of equalising MIMO systems, Pre-distortion in MIMO systems, Disadvantages of pre-distortion in MIMO systems, Pre-coding and combining in MIMO systems, Advantages of pre-coding and combining, Disadvantages of pre-coding and combining, Channel state information.

Unit-3

Codebooks for MIMO, Beamforming, Beamforming principles, Increased spectrum efficiency, Interference cancellation, Switched beamformer, Adaptive beamformer, Narrowband beamformer, Wideband beamformer.

Unit-4

MIMO in LTE, Codewords to layers mapping, Pre-coding for spatial multiplexing, Pre-coding for transmit diversity, Beamforming in LTE, Cyclic delay diversity based pre-coding, Pre-coding codebooks, Propagation Channels, Time & frequency channel dispersion, AWGN and multipath propagation channels, Delay spread values & time variations, Fast and slow fading environments, Complex baseband multipath channels, Narrowband and wideband channels, MIMO channel models

Unit 5

Channel Estimation, Channel estimation techniques, Estimation and tracking, Training based channel estimation, Blind channel estimation, Channel estimation architectures, Iterative channel estimation, MMSE channel estimation, Correlative channel sounding, Channel estimation in single carrier systems, Channel estimation for CDMA, Channel estimation for OFDM

Text Book and References:

ECEE-5113: Biomedical Image Processing

Course Outcomes:

At the end of the course, students will be able to:

- An overview of the computational and mathematical methods in medical image processing
- Learn the medical image analysis of CT, MRI, PET, and ultrasound.
- Learn the noise removal techniques for the medical images.
- Learn the different medical image optimization techniques.
- The course has some crossover with other fields of image and signal processing, and students interested in remote sensing and computer graphics might also find this course helpful.

Syllabus Contents:

Unit-1

Sampling theory, and a variety of interpolation methods, including nearest-neighbour, linear, cubic & higher-order, and Fourier(using the FFT),rigid and non-rigid.

Unit-2

Physics of X-ray, CT, PET, MRI, and ultrasound, properties of the resulting images, advantages and disadvantages of each imaging modality.

Unit-3

Contrast adjustment, denoising (convolution, FFT), deblurring (solving an ill-conditioned sparse linear system), edge detection (numerical approximation to a partial derivative), anisotropic diffusion (numerical solution of partial differential equations), super-resolution.

Unit-4

Correlation, least squares, mutual information, robust estimators, and optimization techniques (fixed-point iteration, gradient descent, Nelder-Mead simplex method, etc.). Implement registration for rigid and non-rigid transformations. MRI motion compensation.

Unit-5

Thresholding, region growing and watershed, method of snakes (adaptive mesh), level set method (numerical solution of partial differential equations), and clustering (classifiers).

ECEE-5114 : Wireless Sensors Networks

Course Outcomes:
At the end of this course, students will be able to

- Design wireless sensor network system for different applications under consideration.
- Understand the hardware details of different types of sensors.
- Understand radio standards and communication protocols.
- Use operating systems and programming languages for wireless sensor nodes, performance of wireless sensor networks systems and platforms.
- Handle special issues related to sensors like energy conservation and security challenges.

Syllabus Contents:

Unit-1
Applications of Ad Hoc Wireless Networks, Issues in Ad Hoc Wireless Networks: Medium Access Scheme, Routing, Multicasting, Transport Layer Protocols, Quality of Service Provisioning, self-organization, Security Addressing and Service Discovery - Energy management Scalability-Deployment Considerations, Ad Hoc Wireless Internet.

Unit-2
Challenges for WSNs–Difference between sensor networks and Traditional sensor networks, types of applications, Enabling Technologies for Wireless Sensor Networks –Single Node Architectures, Hardware Components, Energy Consumption of Sensor Nodes, Issues in Designing a Multicast Routing Protocol.

Unit-3
Flooding and Gossiping, Data gathering Sensor Network Scenarios, Optimization Goals and Figures of Merit, Design Principles for WSNs Gateway Concepts, Need for gateway.

Unit-4
WSN to Internet Communication, Internet to WSN Communication –WSN Tunneling MAC Protocols for Sensor Networks, Location Discovery, Quality of Sensor Networks, Evolving Standards, Other Issues- Low duty cycle and wake up concepts- The IEEE802.15.4 MAC Protocols- Energy Efficiency.

Unit-5
Mobile nodes - Gossiping and Agent based Unicast Forwarding-Energy Efficient Unicast, Broadcast and Multicast, Geographic Routing, Mobile nodes, Security Application Specific Support - Target detection and tracking-Contour/ edge detection- Field sampling.

ECEE-5115: Digital Image and Video Processing

Course Outcomes:

At the end of this course, students will be able to
- Understand the different image formate.
- Learn different techniques for image enhancement, video and image recovery.
- Understand techniques for image and video segmentation.
- Study techniques for image and video compression and object recognition.
- Understand the feature extraction and representation of image and video.

Syllabus Contents:

Unit 1

Digital image and video fundamentals and formats, 2-D and 3-D sampling and aliasing, 2-D/3-D filtering, image decimation/interpolation, video sampling and interpolation, Basic image processing operations, Image Transforms Need for image transforms, DFT, DCT, Walsh, Hadamard transform, Haar transform, Wavelet transform.

Unit 2

Histogram, Point processing, filtering, image restoration, algorithms for 2-D motion estimation, change detection, motion-compensated filtering, frame rate conversion, deinterlacing, video resolution enhancement, Image and Video restoration (recovery).

Unit 3

Discontinuity based segmentation- Line detection, edge detection, thresholding, Region based segmentation, Scene Change Detection, Spatiotemporal Change Detection, Motion Segmentation, Simultaneous Motion Estimation and Segmentation Semantic Video Object Segmentation, Morphological image processing.

Unit 4

Colour fundamentals, Colour models, Conversion of colour models, Pseudo color image processing, Full colour processing.

Unit 5

Lossless image compression including entropy coding, lossy image compression, video compression techniques, and international standards for image and video compression (JPEG, JPEG 2000, MPEG-2/4, H.264, SVC), Video Quality Assessment.

ECE0-5120:Fundamentals of Electronics and Communications (Open Elective)

Course Outcomes:

At the end of this course, students will be able to
- Learn different digital logics and circuit.
- Understand the fundamental of semiconductor devices like diode and BJT and MOS.
- Understand the techniques of analog.
- Understand the techniques of digital communications.
- Study mobile cellular networks.

Syllabus Contents:

Unit-1
Binary Systems: Introduction to Digital Systems, Number systems, binary number system, Decimal to binary & binary to decimal conversion, representation of binary using hexadecimal Boolean Algebra and Logic Gates: Basic definitions, operators of Boolean algebra, basic theorems and properties of Boolean algebra, basic gates -AND, OR, NOT, XOR, NAND, NOR - only truth table & gate representation, Boolean functions, canonical or standard forms

Unit-2
Introduction to Electronic Devices, PN junction diode and characteristics, BJT characteristics, introduction of MOSFET and characteristics, CMOS logic gate.

Unit-3
Introduction to communication, need for modulation, modulation and demodulation techniques AM, FM and PM (Qualitative Analysis only), Block diagram of AM and FM transmitter and Receiver (Qualitative analysis) Sampling theorem, channel capacity, PAM, PPM, PWM and PCM, Digital modulation technique ASK, PSK, QPSK (Qualitative Analysis only).

Unit-4
Introductory Aspects of Multiplexing and Multiple Accesses**:** FDM, TDM, FDMA, TDMA, CDMA and OFDM. Satellite Communication: Introduction, to Orbit, types of orbits, Block diagram of satellite transponder.

Unit-5
Evolution of Communication: 1st generation, 2nd generation, 3rd generation 4th generation and 5th generation mobile communication, Basics of cellular communication (GSM, CDMA)-Cell architecture, Base stations, relay stations and principles of communication, Introduction to Bluetooth, Wi-Fi, and LTE network.
